

I am an ENFJ (Extraverted, Intuitive, Feeling, Judging) type personality. I'm very extroverted and driven to learn anything that comes to me. Even when difficult, no matter how much I complain or say I want to quit, I never do. I'm very academic-driven, I love getting good grades, I love completing my work before due diligence, I like to learn-- but only if my teacher likes to teach. I'm really motivated when I also have an instructor that loves to teach because it makes me engage more. My main challenge is staying with a topic for long. I like to learn new things but too much focus on the topic might affect my attention span. No matter if I love it or hate it. For me after high school, I will attend a university for all 4 years, and if more school is needed then I will stay in school. I intend to major in hospitality, and minor in chem If I find more interest in it. I'm still developing my career interests, but I want to be between Management or Flight attendant. My long-term dreams are to work hard to pay for my grandmother since she worked over her retirement plan to provide for me and my siblings. I want to make enough money to live traveling! as a flight attendant or just as me. I hope to gain new experiences and new knowledge if I get accepted into the program. I can't wait to work and learn.

I've experienced 2 labs in my life, but I loved my recent one when I worked with yogurt to see the bacteria that grows in some brands of yogurt that can fight off your protein. I worked at UH with professor Uyen, in the basement of their chemistry building. The lab research was very intriguing to learn since I'm one of those people who drink yogurt to start their day, so I was really interested in testing yogurts that help build protein for me and my gut microbes. My school doesn't have any health class unless you choose that pathway, so learning about the gut microbe was a new and a different feeling I can't really explain. It's like your first time riding a rollercoaster. No experience of the topic but I was so excited to learn.

What draws me to project SEED is the new science and technology research I get to witness in first view. I learn easier when I'm taught face-to-face and on hand assistance. So, knowing I could get the experience to learn and research a visual product in front of me makes me excited to learn and have passion to attend the Project SEED. This opportunity matters to me personally because I don't really have a plan for my future, I just go with the flow with no directions. Going into the experience I want to see if I could change my career or turn my future around. This could really influence my academic path since I'm not picky with life choices. There is never a yes and no in life, only if you regret your decision in life.
